### Chapter 1

## Introduction

When I start my PhD at ETHZ, artificial intelligence become more and more popular. Then I want to build my own AI program. I want to share my idea with other people, and hope the readers can give their useful comment. Xing Wang

### Chapter 2

## Idea

This chapter will provide the idea of XAI.

#### 2.1 structure

We will start with the .

#### 2.2 Basicbase

Basicbase need write by author. Other word are build by the definitions of the word.

#### Chapter 3

## **Python**

This chapter will introduce the Python techniques used in XAI.

#### 3.1 Modify Module file

When AI learn new things, it need to modify the module file. For example, "yellow skin" means the skin has a property called "yellow". We will add self.properties.append("yellow") in the Skin class file. That means the module file \_skin.py has to change while new knowledge is added. The module file can be changed in different way:

- 1. add new data
- 2. modify old function
- 3. add new function

The most important future of a class definition is that the content of a class is the collection of functions, and the order of the function does not matter, because self are used.

### Appendix A

# **Dummy Appendix**

You can defer lengthy calculations that would otherwise only interrupt the flow of your thesis to an appendix.
